1 Introduction

1.1 Purpose and Scope

This software system test documents specific test procedures and reports test steps and results of the system level tests that demonstrate the PDS 2010 system deployed for Build 2b. It verifies that PDS 2010 system Build 2b is compliant with Build 2 requirements, and ensures that the beta system functions are without critical defects. Test Traceability Matrix can be found in the PDS 2010 Build 2b Test Plan Section 4.

For PDS 2010 Build 2c, the following Prototype Software will be deployed at the EN:

- PDS Ingest subsystem (Harvest, Registry, Inventory, Document, Dictionary services), Report and Security services
- Tools suite (Label design and validation, Label and Schema generation)
- Internal administrative portal

In future tests, the following Prototype Software will be deployed at one or two Discipline Nodes:

- Registry, Harvest services, and Report client

Detailed prototype release description document will be generated to facilitate and to detail the deployment activities.

Test resource will include EN developer to support unit testing, and Integration Team (which consists of EN and Node staff) to perform integration testing.

1.2 Document Revision

Revisions of this document will be held in the PDS Engineering Node website through the use of its document history functionality. Previous versions of this document can be accessed through the use of that tool.

2 Executive Summary

2.1 Assessment

The tools and services tested here work with the versions specified. However, changes to them and/or the information model broke tests that worked previously, and that is very likely to happen again.

2.2 Major Findings

All tested tools and services worked as described in the Service Software Requirements and Design documents above.

2.3 Success

Tools and services performed as documented.

2.4 Metrics

This section provides a summary of the test metrics

# of tests performed	# of tests passed	# of tests failed	# of high priority anomalies
29	28	1	1

3 Test Procedures

The following section lists procedures and results for the test cases identified as the suite of “PDS 2010 Build 2 system tests” in the PDS 2010 Build 2 Test Plan Section 3. These tests will be run as necessary to re-test the system after any software changes.

The test procedures assume the following software are installed locally:

- an XML-friendly web **browser**, e.g. firefox
- **curl**, a command-line utility to access a URL, used here to manipulate a registry. The Registry Service Guide has more information. This is native to most versions of unix.
- an **XML editor**, e.g. eclipse. This can be skipped, though not recommended.
- **Harvest**, <http://pds-engineering.jpl.nasa.gov/pds2010/development/2.2.0/ingest/harvest>
- **Validate**, <http://pds-engineering.jpl.nasa.gov/pds2010/development/2.2.0/preparation/validate>
- **Generate**, <http://pds-engineering.jpl.nasa.gov/pds2010/development/2.2.0/preparation/generate>
- **Catalog**, <http://pds-engineering.jpl.nasa.gov/pds2010/development/2.2.0/ingest/catalog>

The **Registry**, <http://pds-engineering.jpl.nasa.gov/pds2010/development/2.2.0/registry/registry-service/>, can reside remotely or locally, controlled or uncontrolled. Local installation makes testing easier, but installation and configuration can be difficult.

Please follow the installation instructions. For example, the Harvest and harvest-ctrl commands usually require editing to use the correct registry, and those two and Validate also require editing to set environment variable JAVA_HOME.

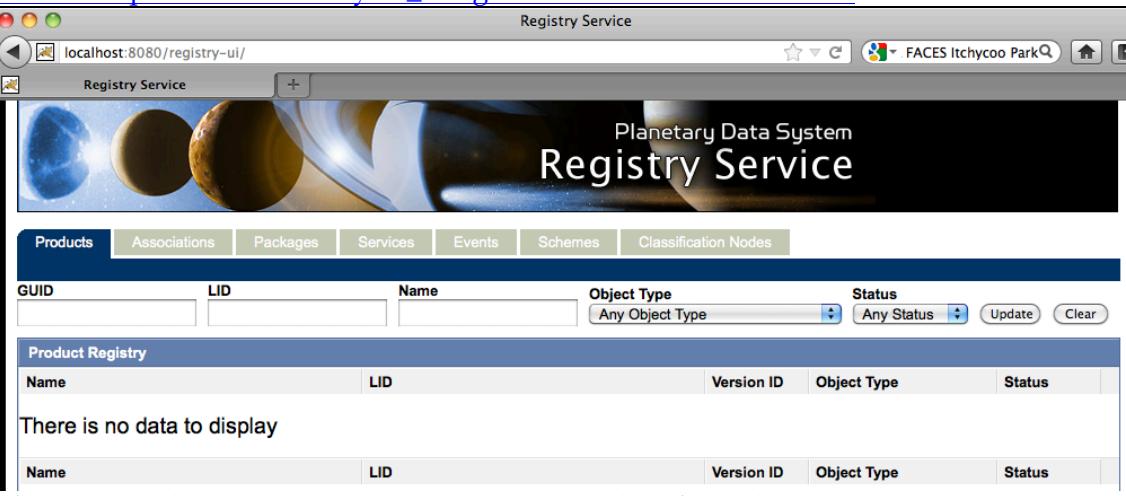

The tests are written for Unix, though running on Windows should require only simple changes.

In the test procedures below, globally replace:

<i>testDir</i>	directory where input files are extracted
<i>harvestOptions</i>	<ul style="list-style-type: none"> • If the registry is uncontrolled, nothing • Else “-uusername -ppassword” Add “-k keystorePassword” depending on the registry configuration, e.g. if Harvest gives error “Keystore password must be specified”
<i>curlOptions</i>	<ul style="list-style-type: none"> • If the registry is uncontrolled, nothing • Else “-uusername:password -k”
<i>registryURL</i>	Depends. <ul style="list-style-type: none"> • http://localhost:8080, local, uncontrolled. Requires installing and configuring Apache Tomcat and the Registry Others that may be available: <ul style="list-style-type: none"> • https://localhost:8080, local, controlled. Requires installing and configuring Apache Tomcat, the Registry, and Security

Description	Create a PDS Product Label using a design tool that initiates from an existing or a blank schema, accepts schema specification from a URL or a filename, facilitates editing of the label via standard editing features, validates, exports the schema, and generates the file for the product.

Harvest registered product holdings/minimalImage.xml because it has a <product_class> that matches one of harvestPolicy.xml's objectType. Step 4 shows the registration of the product referred to in minimalImage.xml as well as two extra products associated with this product: the metadata file (i.e. the label) minimalImage.xml and the data file i943630r.raw.

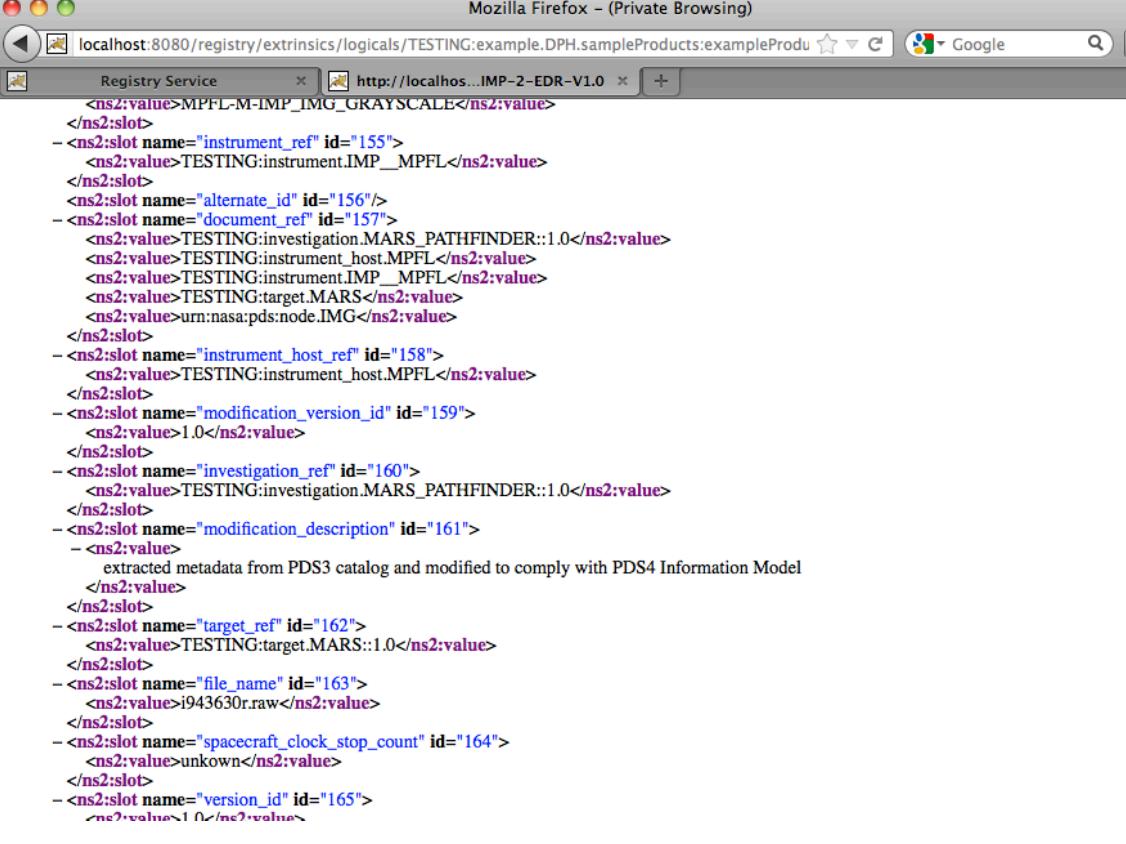

The screenshot shows a web browser window titled "Registry Service" at "localhost:8080/registry-ui/". The main content area is titled "Product Registry". Below the title is a table with the following data:

Description	Query and delete associations (not just products). When Harvest registers a product, it also registers associations to the XML label file and to the referenced data file. These associations (non-LID-based) can be deleted.
Test Steps	<ol style="list-style-type: none"> 1. AATESTME.T6's Test Results, step 2's output includes the GUID (highlighted) of the association between the data product and the file. Replace <i>guid</i> below with the GUID <code>http://localhost:8080/registry/associations/guid</code> 2. curl -X DELETE -v http://localhost:8080/registry/associations/guid 3. View association: use the GUID (highlighted) of the association registered in step 5: http://localhost:8080/registry/associations/guid 7. Delete association's source object: use the GUID (highlighted) of the product registered in step 5, which was also the value of sourceObject in step 6: <code>curl -v -X DELETE http://localhost:8080/registry/extrinsics/guid</code> 8. Comments	catalog -mcompare does well but could be better. In step 2, the second file has only 1 extra token, which then causes a cascade of different line breaks. However, the tool shows all lines of the difference. It would be better to show only the different token plus a few tokens around it.

Comments	When validating voldesc.cat, catalog -mvalidate reports that the label fragment, e.g. file DATASET.CAT, "should not contain a PDS_VERSION_ID". Of course, such files must have PDS_VERSION_ID. This is a problem carried over from PDS3.

Description	Ingest a catalog submission into the registry service
Test Steps	<p>The catalog ingest requires the registry, transport, and storage services be configured together, which is likely too complex for local testing. So before testing:</p> <ul style="list-style-type: none"> • The registry resides at <code>https://potato.jpl.nasa.gov/registry</code> • The administrator of the registry provides: <ul style="list-style-type: none"> ◦ a keystore (in this example, the file is <code>/somewhere/keystore</code>) ◦ a keystore password (e.g. <code>hellodps</code>) ◦ URL for the registry (<code>https://potato.registry.jpl.nasa.gov</code>) ◦ URL for the storage service (<code>http://potato.jpl.nasa.gov:9100</code>) ◦ URL for the transport serv (<code>http://potato.jpl.nasa.gov:80/cas-product</code>) ◦ username/password for the security service (<code>rchen/new4rchen</code>) • The keystore has been copied/moved to <code>/somewhere/keystore</code> • In the local script catalog (or <code>catalog.bat</code>), the java command has parameters <ul style="list-style-type: none"> ◦ <code>-Dpds.registry="https://potato.registry.jpl.nasa.gov/registry"</code> ◦ <code>-Dpds.security.keystore="/somewhere/keystore"</code> • To simplify the command-line, create a configuration file named config: <pre>citool.mode = ingest citool.user = rchen citool.pass = new4rchen citool.serverUrl = http://potato.jpl.nasa.gov:9100 citool.transportUrl = http://potato.jpl.nasa.gov:80/cas-product citool.keypass = hellodps citool.verbose = 1</pre> <ol style="list-style-type: none"> 1. <code>catalog -cconfig -t testCatalog/CORPWS_0164/ -r ctlg1.out</code> 2. Step 2:

The screenshot shows the Registry Service interface with the title 'Registry Service'. The main area displays a table titled 'Product Registry' with 21 rows of data. The columns are: Name, LID, Version, Object Type, and Status. The data includes various PDS products like RPWSINST, CASSINI, and VOLDDESC, along with their respective LIDs and status as 'Submitted' or 'Collection_Volume_PDS3'. At the bottom of the table, there is a navigation bar with buttons for 'Name', 'LID', 'Version', 'Object Type', and 'Status', and a message 'Total Records: 21'.

The PDS3 file has: <code>^TABLE = "ELE_MOM.TAB"</code> What's the correct way to handle the caret in the template? Because of this, data.vm has <code><file_name>\$label.PRODUCT_ID</file_name></code> instead of the more correct <code><file_name>\$label.^TABLE</file_name></code> 2. The template has <code><dph:spacecraft_clock_start_count>2/20541:22:726</dph:spacecraft_clock_start_count></code> But the output strips off dph: 3. I don't think #foreach alone suffices. What other looping construct can I use? My pds3.lbl has <code>OBJECT = TABLE</code> <code>OBJECT = COLUMN</code> <code>A = X</code> <code>B = X2</code> <code>END_OBJECT = COLUMN</code> <code>OBJECT = COLUMN</code> <code>A = Y</code> <code>B = Y2</code> <code>END_OBJECT = COLUMN</code> <code>OBJECT = COLUMN</code> <code>A = Z</code> <code>B = Z2</code> <code>END_OBJECT = COLUMN</code> while my .vm file has <code>#set(\$fieldCharacterList =</code> <code>\$label.getRecords('TABLE.COLUMN.A','TABLE.COLUMN.B'))</code> <code>#foreach(\$fieldCharacter in \$fieldCharacterList)</code> <code> <Field_Character></code> <code> <name>\$fieldCharacter.A</name></code> <code> <field_number>\$fieldCharacter.B</field_number></code> <code> </Field_Character></code> <code>#end</code> However, generate doesn't produce 1 Field_Character (the last one), not 3. 4. Comments	Validate seems to ignore the file's "<?xml-model href="http://...sch"?>". That may be reasonable behavior, but perhaps it would be more transparent if validate 1) tried the default schematron, 2) upon failure tried the schematron listed in the file and noted that in the output. http://oodt.jpl.nasa.gov/jira/browse/PDS-85

Test Case ID	REG.T2 *obsolete
Description	Relate artifact registrations, regardless of whether artifact has been registered yet
Test Steps	<ol style="list-style-type: none"> 1. <code>http://localhost:8080/registry/associations/linkREG.T1toREG.T2a</code> Somehow shows no such associations 2. <code>curl curlOptions -X POST -H "Content-type:application/xml" -v -d @testRegistry/test.REG.T2.xml http://localhost:8080/registry/registry/associations -uusername:password -k</code> adds 1 association (from a nonexistent sourceLid) to desired targetLid 3. Repeat step 1 to see the association (POSTing the sourceLids referenced in steps 2 and 3 is actually unnecessary)

The packages have version names like "1.0" and "20120210163524", and various descriptions such as "This configures the core set of registry objects" and "This configures PDS object types". The XML uses namespaces like ns2 and ns3.</p>

	<p>The screenshot shows the PDS: Search Results page from pdsbeta.jpl.nasa.gov. The search term 'cassini cda' has returned 11 results. The results are categorized under 'Data Sets and Information'. The first result is 'CASSINI COSMIC DUST ANALYZER CALIBRATED/RESAMPLED DATA' from the CASSINI-HUYGENS mission. Other results include various instruments like HRD, CO, and CCD systems from missions like Cassini, Lowell, and AUSTC14.</p>

Test Case ID	SCH.T5
Description	Search based on a sequence of open text keywords. Do so in a browser.
Test Steps	<p>Compare the PDS4 (http://pdsbeta.jpl.nasa.gov/tools/data-search) and the PDS3 (http://pds.nasa.gov/tools/data-search/) results for the following searches:</p> <ol style="list-style-type: none"> 1. mro spice 2. cassini cda 3. voyager plasma wave. In Refine Your Search, click "Comet SL9/Jupiter Collision" 4. mars digital elevation maps 5. neptune 6. jupiter images 7. corona 8. NEAR-A-SPICE-6-EROS/ORBIT-V1.0 (a specific data set ID)
Test Results	<p>All searches complete successfully. "Good" and "Bad" refer to PDS4 relative to PDS3:</p> <ol style="list-style-type: none"> 1. PDS4 returns 344 results; PDS3, 15. Both list the desired dataset first. Good: has instrument info Bad: After the first dataset, the next datasets are other SPICE datasets – it would be better to have other MRO datasets next. 2. Bad: the PDS4-unique results are 5 instruments whose relationship to the search terms is unclear. Also, wrt the first test, why does PDS4 not return hundreds of results about Cassini? 3. Probably good: no "Search Tool: Comet Data Searcher" Maybe good: PDS3 has 9 datasets; PDS4, 36. The extras are remotely related. 4. Apparently, "digital elevation map" is not a commonly used term. Both have mostly irrelevant results Bad: PDS3 has the 2 best results, datasets "VO1/VO2 MARS VISUAL IMAGING SUBSYSTEM DIGITAL TERRAIN MODEL" and "MRO-M-HIRISE-5-DTM-V1.0". PDS4 does not have those at all. 5. Good: 2 extra search tools, 11 extra targets, 10 extra instruments. Avoided bad instrument LONG RANGE RECONNAISSANCE IMAGER on New Horizons. Bad: 1 wrong mission (NH) 6. PDS4 returns 771 results; PDS3, 122 Probably good: avoiding dataset "EAR-J-KECK-3-EDR-SL9-V1.0", which seems preliminary. Probably bad: many irrelevant datasets are near the top, e.g. Rosetta-Orbiter data. 7. Good: 3 missions SUISEI, VEX, ULY. 1 instrument (OMAG on PVO) and maybe the Radio Science instruments. 8. PDS3 returns 1 result. PDS4 returns 8374. PDS3's result is probably better.
Comments	<p>This happens with PDS3 as well. After searching and then refining a search (clicking on something in the left column), if the user types a new search term in the middle of the page, the new search is actually a refinement, not a new search. I'd prefer either a new search or something on the web page indicating that the typed-in text will refine the current results. (This happened in going from step 3 to step 4 above)</p> <p>https://oodt.jpl.nasa.gov/jira/browse/PDS-86</p>

Test Results	All searches complete successfully. "Good" and "Bad" refer to PDS4 relative to PDS3: 1. Good: mission MGS Bad: missions Apollo 12 and MRO 2. Bad (minimally): two probably irrelevant datasets GO-J-UVS-2-EDR-JUPITER-V1.0 and IRAS-FPA-6-RDR-INSTRUMENT-INFO-V1.1
