PDS-NSSDC Interface Test Report Test Phase I

November 8, 2005

Jet Propulsion Laboratory
Pasadena, California

Test Summary

This document details the test report for Phase I of the PDS-NSSDC Interface Test Plan (Version 1.1, January 3, 2006). This test was conducted between the dates of October 24, 2005 to November 8, 2005. Below is a summary for each of the steps defined in the test plan. The details of the test can be found in the Test Detail section.

Create AIP

The two AIPs corresponding to the two selected volumes were created successfully utilizing the MPGA software. Creation of the AIPs took approximately 100 minutes for each AIP. Each volume is approximately 600 megabytes in size.

Transfer AIP

The two AIPs were successfully transferred to NSSDC via FTP. The first AIP (mgst_1230) took approximately 35 minutes (280 Kilobytes/second) to transfer. The second AIP (mgst_1232) took approximately 26 minutes (370 Kilobytes/second) to transfer. The NSSDC staff was notified via e-mail regarding the successful transfer:

Pat,

The AIP files are out there and ready to go. Let me know when you want to send them back or have us grab them off of your FTP server.

Retrieve and Store AIP

This step is performed by NSSDC staff at the NSSDC. The following e-mail was received from Pat McCaslin regarding the process and some issues that came up at the NSSDC:

Date: Mon, 07 Nov 2005 16:30:38 -0500
From: Patrick McCaslin <mccaslin@mail630.gsfc.nasa.gov>
Subject: AIPs ready for retrieval

Sean,

The two AIPs are available for you to retrieve. They were written to DLTs in our jukebox and then retrieved from tape and written into the disk directory where you originally delivered them. I wish I could say that the process was

automatic and smooth. There were some hitches. I ended up manually performing the activities that would happen in a normal ingest process. The end result is that the AIPs were written to media and then retrieved exactly the way they would have had the automated system worked. However, these AIPs are not being tracked in our archival storage inventory.

In your directory there should be a command file 'PDS-PACKAGE-GENERATOR.v2.splitter.cmd' that can be run to retrieve data from the AIPs. The associated parameter file 'PDS-PACKAGE-GENERATOR.v2.splitter.lst' is set up to open an AIP using the original name: 'TPDS0000000001_AIPfile.sfd.testfile'.

Here were the significant problems encountered on this end:

1. All AIPs generated with Mark's demonstration package have the same name. That can be worked around by renaming files and editing the output log file. What should have occurred to me and didn't was the fact that all AIPs generated with the demonstration package have the same Archival Storage ID (ASID) which is stored in the attributes object of the AIP. The NSSDC ingest system checks ASIDS of incoming AIPs to ensure that there are no duplicate ASIDS. Only one of the test AIPs could have been stored and then tracked in the archival inventory system.
2. The process of ingesting a PDS AIP disclosed a bug in the NSSDC ingest system. The attributes of PDS AIPs present a processing case that the NSSDC has never handled. As it stands now, no PDS AIP could be ingested normally and then tracked in the inventory. We've identified the necessary fix but it will probably take a few weeks to do it.

Pat

Request and Transfer AIP

Following the notification via e-mail from the previous step, the two AIPs were successfully transferred from NSSDC via FTP. Both AIPs were contained in a single TAR file, which took approximately 158 minutes (130 kilobytes/second) to transfer.

Retrieve and Verify AIP

The two AIPs were successfully extracted into their original volume structures, respectively. Checksum reports were generated against the extracted volume structures and compared against the original checksum reports. The reports were identical marking the successful completion of the test.

Test Detail

This is a log file for the MPGA software v2 test. Comments and explanation of steps performed to test the software are denoted in bold.

SUMMARY:

- Tests were run successfully on the mgst 1230 and mgst 1232 volume data sets.
- The mex data test failed just as it did in the test of the previous MPGA version.

MGST 1230 DATA SET VOLUME TEST

Get the checksums of every file in the PDS volume we are about to run on the MPGA software and save the results onto a file.

Capture the run-time execution for this program. The command we will eventually run is `./COMMANDS/PDS-PACKAGE-GENERATOR.v2.interactive`, which calls `PDS-PACKAGE-GENERATOR.batch`. So, in order to capture the run-time execution, you will need to modify the

PDS-PACKAGE-GENERATOR.batch file and place a "time" command in front of the program call.

(NOTE: At first, I tried typing in "time ./COMMANDS/PDS-PACKAGE-GENERATOR.v2.interactive" and it gave me the time stats immediately after it notified me of running in the background.)

```
[mdc@starburst bin]$ pwd
/home/mdc/mpga_v2/bin
[mdc@starburst bin]$ emacs COMMANDS/PDS-PACKAGE-GENERATOR.batch &
[4] 17690
```

The .batch file now looks like the following:

```
[mdc@starburst bin]$ more COMMANDS/PDS-PACKAGE-GENERATOR.batch
time ./MPGA-launch \
  -workdir=./MPGA_WORKING_DIR/ \
  -setup=PDS-PACKAGE-GENERATOR.v2.setup \
  -input=./INPUT_LISTS/pds_MPGA_DEMO-2.lst \
  -mlst_tspec=./TEMPLATE_SPEC/PDS-PACKAGE-GENERATOR.v2.mlst.tspec \
  -agen_tspec=./TEMPLATE_SPEC/PDS-PACKAGE-GENERATOR.v2.agen.tspec \
  -output=out-PDS-PACKAGE-GENERATOR.diag -log=out-PDS-PACKAGE-GENERATOR.log &
[4] Done          emacs COMMANDS/PDS-PACKAGE-GENERATOR.batch
[mdc@starburst bin]$
[mdc@starburst bin]$
```

Call the command to start the MPGA software.

```
[mdc@starburst bin]$
[mdc@starburst bin]$ ./COMMANDS/PDS-PACKAGE-GENERATOR.v2.interactive
```

Welcome to the simple MPGA interactive calling program.

The current Directory to Package is:

```

Please enter a new directory, or hit return to keep the current one:

```

```

```

Created 2 files in the /home/mdc/mpga_v2/bin/OUTPUT directory: an attributes file and a data file

Output file names and file sizes are listed below:

TPDS0000000001.att 241605 bytes
TPDS0000000001.dat.tar 614645760 bytes

A .diag and a .log file were also created in the /bin directory:

DATA RETRIEVAL TEST

This log shows the procedure for testing and retrieving the data sets from the AIP files.

SUMMARY:

- Data sets of mgst 1230 and mgst 1232 were successfully extracted from both AIP files retrieved from the NSSDC.

Log onto nssdcftp.gsfc.nasa.gov from the starburst machine

We have both AIP files in the bin directory. Perform test to see how the splitter command will react

We expect to see a FAILURE response in this case since the command looks for an AIP file specifically named "TPDS0000000001_AIPfile.sfd.testfile." So we need to rename the AIP file to that first.
